### Marine Diesel Engine Curve

Cummins Marine Diesel Performance Curves. Understanding your Cummins Marine engine performance curve can help you improve performance without wasting precious fuel. Every engine has a unique set of performance curves, so it's important to make sure you have the correct curves, including the proper Horse Power, CPL designation and rating classification.

curves, it indicates that propeller power at 2,300 RPM is 250, but that the engine is putting out about 380 HP at that same speed. What happened to the missing 130 horse-power? The answer is that the engine isn't generating it. A diesel engine's power at any RPM is controlled by how much fuel is metered into the injectors.

HP= (Torque x RPM)/5250. You can measure torque and RPM and you have to calculate the Horsepower (HP) from them and not vice versa. A typical engine performance curve is shown below: Fig.1: Engine Performance Torque Curve. Torque curve (shown in Dark red color) is the graph plotted between torque and RPM of the engine.

The horizontal axis shows engine speed in revolutions per minute (RPM) and the vertical axis indicates power in both kWm and in HP. There are two curves shown and the testing standards are indicated (ISO 3046). Typically these curves are referred to as "continuous" (the lowest output), and "intermittent" (the upper curve).

The push rods of these engines are also about 33% longer than most 4 stroke engines, creating more rotational mass and therefore more rotational torque. Altogether, the engine delivers more power from less displacement, lower speed, but higher casting weights, while fuel consumptions remain approximately the same.

It is interesting to note that the formula also verifies the typical torque bell curve when the torque trails off as rpm increases at the top end. One may consider that engines making torque at a lower rpm tend to work better in marine applications due to the fact that "most" boats tend to plane in the range of 2,000 - 3,000 rpm.

Marine Engines Are Heavy Duty. A car engine typically only uses a portion of its horsepower to maintain a decent speed on the road. On the other hand, a marine engine is essentially at full throttle all the time just to move it through the water, so it has to be pretty heavy duty to keep up.

### What's the Difference Between Marine Motors and Car Motors ...

Brake-specific fuel consumption (BSFC) is a measure of the fuel efficiency of any prime mover that burns fuel and produces rotational, or shaft power. It is typically used for comparing the efficiency of internal combustion engines with a shaft output.. It is the rate of fuel consumption divided by the power produced. It may also be thought of as power-specific fuel consumption, for this reason.

The average marine gasoline engine runs for 1,500 hours before needing a major overhaul. The average marine diesel engine will run for more than three times that long and log an average 5,000 hours under the same conditions. The number of hours that a marine engine runs is very dependent on the amount and quality of maintenance over the years.
